

Failure modes should be read as program-relevant judgment gaps

These categories should be replaced or quantified after trajectory review, but they define the expected diagnostic frame.

Literature prior over evidence

Importing the known mechanism of a compound instead of reading the supplied assay footprint.

decryptM, decryptE

Assay-context calibration failure

Using the right workflow with the wrong tolerance, prompt context, species, or source convention.

DM, DE, PK

Multi-property integration gap

Optimizing one attractive value while missing the property that changes the advancement decision.

PK, ADMET, MPO

Rigid threshold shortcut

Treating a rule-of-thumb cutoff as dispositive when margin or protocol context changes the call.

PK / ADMET, TG
